

THE STICK & TISSUE BUILDER'S "CRESCENT WRENCH"

By George White

Just as the crescent wrench can be the answer to many mechanical tasks, the little Swiss Army Knife can be the answer to many of the things we folk who struggle with applying tissue to models. No, this is not the 1/2 pound thing which has everything in it that you could dream of. It's only 2 1/4" long and called the "Victorianox" knife. It has an extremely sharp pair of small scissors, a toothpick, a pair of tweezers, a nail file and a (if you can imagine!) a knife blade. They're available at WalMart in the gun department and cost about \$8. The scissors are especially handy for getting into awkward places and doing that snipping of tissue, even when wet, where it's needed.

I carry one in my pocket, in my flight box and one on the bench. I wouldn't leave home without one!!
