

TRIMMING AID FOR GLIDERS

By George White

While going through some old NFFS Digests, I ran across an article by Bob Johannes offering tips on cat gliders. Most of his tips are fairly well known, but he offered one idea I had not heard discussed before. He says to glue 3/8" long strips of very thin copper wire to the rear of both the fin and the stab. That will enable you to make small bends in those surfaces for trimming and the copper wire will ensure the bends remain as you want them.
