

Model Boxes Made With Foam

By George White

In a recent email exchange concerning the use of foam for building with **Mike Isermann** of FAC fame in Houston, he mentioned the use of foam to build boxes to keep and transport models. He sent the pictures below. He says that he uses 1/2" thick blue or pink foam, which he glues together with Liquid Nails. He sticks small nails into the joints to hold it together while the glue is drying. He then reinforces the joints with the stickiest 2" wide tape you can find. He says that the great thing is that you can build supports for your planes and glue them in as well. Sounds like he's got a great idea here.
