REMOVING WING WARPS
An idea published in the June 2015 issue of the Brainbuster newsletter, Abram Van Dover Editor

1. Warped wing panel pinned flat to work board

2. Damp towel laid over wing panel

3. Electric heating pad laid over towel

Heat wing 30 min under high setting — cool 30 min before removing pins —

Jack Brombly, Lancaster, Calif., recommends use of damp towel and heating pad for straightening warped wings. Important to leave wing pinned in place for half hour after steaming, says Jack.
